Hello,

Let me introduce you to the idea behind La Receta. La Receta is a fresh new and improved food blog concept where you can find all the trouble-free and tasty food recipes you can do at home. Satisfy any craving you have at any time any day. That's not the best part. You can be part of our community! Fun, right? Help yourselves, create your account, log in and contribute some of your own recipes while getting inspired by other members' magical creations. Get creative and reveal your inner chef!

When it comes to food and the satisfaction that comes along with it, the sky is the limit. Therefore, one can please their appetite no matter the type. Do you consider yourself to be a dessert lover? Salty? Salad? Or Drink Lover? No matter the answer, we got you covered. Check out our different categorical pages where whatever suits your craving at the moment, we have the recipes for you ready and in your hands within minutes.

The app is designed for everyone's comfort and entertainment. From the beginner chefs to the head chefs out there! Learn, Contribute, eat and repeat.

We hope to see you as part of our community!

Sincerely,

La Receta Team

Code Testing:

When you download the src folder, inside it you will find a php folder where every API is present. So, this means, that the whole project must be inside the htdocs folder so it can be tested.

           g app.comp
           App.com
                       onent.spec.ts
loginUser(user: User) {
                      ponent.ts
                                                               return this.http.post(this.base_url + 'login.php', user);
              app.module.ts
                                                            registerUser(user: User) {
        > 🔣 env
                                                              return this.http.post(this.base_url + 'register.php', user);
        > 🔚 php
         > 👺 theme
                                                             createRecipe(recipe: Recipe) {
          global.scss
                                                               return this.http.post(this.base_url + 'createRecipe.php', recipe);
             index.html
          main.ts
                                                             getRecipe(id) {
```

As you can see in the above screenshot, the php folder is inside the src folder. Also, do not forget to change the base url to which it works for you (check the white rectangle).

The database file is added to the repository, which is named 'larecetamobile' and contains 3 tables (users, recipes, and contactus).
